

SAROJ KUMAR VAISHYA

Software Engineer | Java & Microservices Developer

sarojk.work@gmail.com | +91-8109042327 | LinkedIn: in/saroj-kumar-vaishya/
portfolio: <https://saroj789.github.io/portfolio/>

SUMMARY

Software Engineer with 4+ years of experience in Java, Spring Boot, and microservices development, specializing in reactive and asynchronous systems, event-driven architecture, and enterprise integration.

Skilled in building scalable, resilient backend systems using Spring WebFlux, Project Reactor, GCP, distributed caching, and fault-tolerant design patterns. Strong background in performance optimization, database tuning, and production issue resolution, with a proven track record of improving system reliability and responsiveness under high traffic.

SKILLS

- **Languages:** Java (8–21), SQL, JavaScript
- **Databases:** Oracle
- **Backend Technologies:** Spring Boot, Spring WebFlux, Project Reactor, Apache Camel, Hibernate
- **System Design & Architecture:** Microservices • Event-Driven Architecture • RESTful APIs
- **Cloud & Distributed Systems:** GCP Pub/Sub, Kafka, Redis, Secret Manager, Resilience4j
- **Testing & DevOps:** JUnit 5, Mockito, Reactor Test, Maven, Git, JBoss

EXPERIENCE

Infosys | Software Engineer (Apr 2025 – Present)

Client: Macys · Retail Technology

Mobile Browse Experience API (Oct 2025 – Present)

Tech Stack: Java 21 • Spring WebFlux • Reactor • Redis • GCP Pub/Sub • Resilience4j • Protobuf

- Engineered asynchronous microservices for mobile product search & recommendations using Spring WebFlux and Project Reactor.
- Improved API response times by 30–40% using Redis caching and fallback mechanisms.
- Enhanced system resilience by implementing Resilience4j patterns (Circuit Breaker, TimeLimiter, Bulkhead), increasing availability by 30% under peak loads.
- Built orchestration layer integrating Search, Product, Promotion, and Recommendation services, reducing downstream latency.
- Delivered versioned REST APIs ensuring backward compatibility across mobile releases.
- Optimized asynchronous workflows to minimize blocking operations and improve scalability under high traffic conditions.
- Enhanced responsiveness and reliability of customer-facing mobile APIs under high concurrent traffic.

Affinity Private Label Flow—BizTalk to Apache Camel Migration (Apr 2025 – Oct 2025)

Tech Stack: Java 21 • Spring Boot • Apache Camel • GCP • Oracle • SQL Server

- Modernized legacy BizTalk integrations using Spring Boot and Apache Camel microservices, improving scalability and reliability.
- Designed event-driven workflows with GCP Pub/Sub for high-volume retail purchase order processing.
- Built 11+ Apache Camel routes for orchestration, validation, and transformation.
- Engineered SOAP/REST integrations with retry and circuit breaker mechanisms, strengthening resilience.
- Developed validation engine with 15+ business rules ensuring purchase order accuracy.

Newgen Software | Java Developer (Jul 2022 – Mar 2025)

Banking & Financial Services

Account Modification System | IDBI (Jan 2024 – Mar 2025)

Tech Stack: Java • Spring Boot • Oracle • Spring Batch

- Developed REST APIs for banking workflows — ReKYC, nominee updates, and customer profile management for IDBI Bank.
- Built a scheduled Spring Batch utility (hourly) that reads KYC data from DB, validates it, calls the Bank API, logs request/response to an audit table, and updates KYC completion status — fully automating the ReKYC pipeline.
- Designed audit trail logging for all account modification operations, ensuring regulatory compliance and traceability.
- Optimized SQL queries and Hibernate mappings, reducing API latency by 25% under concurrent banking load.

Document Approval System | Central Bank-Coforge (Jul 2022 – Dec 2023)

Tech Stack: Java • Spring Boot • Oracle • JavaScript • Jboss

- Built REST APIs for document workflows and multi-stage approval tracking with role-based access control for Central Bank of India.
- Integrated with Newgen's workflow engine to orchestrate parallel and sequential approval stages across banking departments.
- Reduced query response time by 30% through SQL optimization and indexing on high-volume document tables.
- Decreased production incidents by 20% through systematic performance tuning, code reviews and improved error handling.

EDUCATION

B.Tech in Computer Science & Engineering

SATI, Vidisha, Madhya Pradesh | 2018 – 2022 | CGPA: 7.76

KEY ACHIEVEMENTS

- Improved API response times by 30–40% using distributed caching and reactive processing.
- Modernized legacy integration platforms into scalable microservices architectures.
- Built resilient backend systems for high-volume retail and banking workflows.
- Reduced production incidents by 20% through performance optimization and reliability improvements.
